CodeV awarded by BES Innovation 2011 in the area of Information as Services Technologies

An innovative technology that allows to detect and correct, in real time, problems of software security – CodeV -developed by the Start Up of the University of Coimbra Dognædis, won the BES Innovation 2011 award in the area of Information and Services Technology.

CodeV (Verification Code) is an «intelligent inspector-professor that detects security problems on software, through all of its development phases, fires alerts, produces reports and gives instructions towards the fast correction of identified problems. In sum, it is a computer security expert», explains Francisco Rente, researcher of UC and Executive Director of Dognædis.

Dognædis is a technology company specialist in information security, formed by researchers of the college of Science and Technology of the University of Coimbra (FCTUC).
